1 Features

1 - 1 RXMLQ-T

Where heating is priority without compromising on efficiency

1

› Outdoor unit module for VRV IV C-series heat pump to create systems from 16 up to 42HP

› Free combination of outdoor units to meet installation space or efficiency requirements

Inverter

1 Features

1 - 2 RXYLQ-T

Where heating is priority without compromising on efficiency

- › By choosing a LOOP by Daikin product you support the reuse of refrigerant, for more information visit www.daikin.eu/loop-by-daikin
- › Specifically developed for heating operation in low ambient conditions, making it suitable for single source heating
- › Stable heating capacity down to -15°C, thanks to vapour injection compressor
- › Extended operation range down to -25°C in heating
- › High reliability in severe conditions, thanks to hot gas bypass circuit in the heat exchanger
- › 15% increased heating capacity at high relative humidity (2°CDB/1°CWB and RH=83%) vs previous model
- › Shorter defrost and heat up time, compared to standard VRV heat pump
- › Covers all thermal needs of a building via a single point of contact: accurate temperature control, ventilation, air handling units and Biddle air curtains
- › Wide range of indoor units: possibility to combine VRV with stylish indoor units (Daikin Emura, Perfera, ...)
- › Incorporates VRV IV standards & technologies: Variable Refrigerant Temperature, VRV configurator, 7 segment display and full inverter compressors, 4-side heat exchanger, refrigerant cooled PCB, new DC fan motor, ...
- › Customize your VRV for best seasonal efficiency & comfort with the weather dependant Variable Refrigerant Temperature function. Increased seasonal efficiency with up to 28%. No more cold draft by supply of high outblow temperatures
- › Already fully ErP 2021 compliant (LOT 21 - Tier 2)
- › Free combination of outdoor units to meet installation space or efficiency requirements
- › High external static pressure (up to 78.4Pa) allows indoor installation
- › Simplified installation & guaranteed optimal efficiency with automatic charging & testing
- › Easy compliance with F-gas regulation thanks to automated refrigerant containment check
- › Wide piping flexibility: 30m indoor height difference, maximum piping length: 190m, total piping length: 500m

Electrical Specifications			RXMLQ8T
Power supply	Name		Y1
	Phase		3N~
	Frequency	Hz	50
	Voltage	V	380-415
Power supply intake			Both indoor and outdoor unit
Voltage range	Min.	%	-10
	Max.	%	10
Current - 50Hz	Starting current (MSC) - remark		See note 8
	Zmax	List	No requirements
	Minimum Ssc value		5,638 (4)
	Minimum circuit amps (MCA)		16.1 (5)
	Maximum fuse amps (MFA)		20 (6)
	Total overcurrent amps (TOCA)		42.5 (7)
	Full load amps (FLA)	Total	15 (8)
Wiring connections - 50Hz	For power supply	Quantity	5G
	For connection with indoor	Quantity	2
	Remark		F1F2

(1) Sound power level is an absolute value that a sound source generates. |

(2) Sound pressure level is a relative value, depending on the distance and acoustic environment. For more details, please refer to the sound level drawings. |

(3) Refer to refrigerant pipe selection or installation manual |

(4) In accordance with EN/IEC 61000-3-12, it may be necessary to consult the distribution network operator to ensure that the equipment is connected only to a supply with Ssc ≥ minimum Ssc value |

(5) MCA must be used to select the correct field wiring size. The MCA can be regarded as the maximum running current. |

(6) MFA is used to select the circuit breaker and the ground fault circuit interrupter (earth leakage circuit breaker). |

(7) TOCA means the total value of each OC set. |

(8) FLA means the nominal running current of the fan |

Cooling: indoor temp. 27°CDB, 19°CWB; outdoor temp. 35°CDB; equivalent piping length: 7.5m (horizontal); level difference: 0m |

Heating: indoor temp. 20°CDB; outdoor temp. 7°CDB, 6°CWB; equivalent refrigerant piping: 7.5m; level difference: 0m |

Actual number of connectable indoor units depends on the indoor unit type (VRV indoor, Hydrobox, RA indoor, etc.) and the connection ratio restriction for the system (70% ≤ CR ≤ 130%) |

RLA is based on following conditions: indoor temp. 27°CDB, 19°CWB; outdoor temp. 35°CDB |

MSC means the maximum current during start up of the compressor. This unit uses only inverter compressors. Starting current is always ≤ max. running current.

4 - 1 Combination Table

RXMLQ-T
VRV4
RXYLQ-T
Heat pump
Indoor unit combination restrictions

(1/2)

Indoor unit combination pattern	VRV* DX indoor unit	RA DX indoor unit	Hydrobox unit	Air handling unit (AHU) ⁽³⁾
VRV* DX indoor unit	O	O	O	O
RA DX indoor unit	O	O	X	X
Hydrobox unit	O	X	O ₁	X
Air handling unit ⁽³⁾	O	X	X	O ₂

O: Allowed
X: Not allowed

Notes

- VRV* DX indoor unit
 - When combining VRV DX indoor units with other types of indoor units, respect the following combination patterns:
 - Example
Allowed : [VRV DX indoor unit + Hydrobox unit] or [VRV DX indoor unit + RA DX indoor unit] or [VRV DX indoor unit + AHU]
Not allowed : [VRV DX indoor unit + (RA DX indoor unit & (Hydrobox unit or AHU))] or [VRV DX indoor unit + (Hydrobox unit & (RA DX indoor unit or AHU))]
- O₁
 - Only connect Hydrobox units to a VRV IV Heat Pump in combination with a VRV DX indoor unit.
 - Refer to the connection ratio restrictions (3D079540 & 3D117169).
 - Connection with only Hydrobox units: refer to the Daikin Altherma solutions.
 - Only connect Hydrobox units of the HXY* series.
 - HXHD* series Hydrobox units are not allowed.
- O₂
 - Combination of AHU only + control box EKEQFA (the combination with VRV DX indoor units is not allowed; maximum 54HP for 400 + 2x500 class EKEQV kit)
 - X-control is possible (up to 3x [EKEQV+EKEQFA* boxes] can be connected to one outdoor unit (system)). No Variable Refrigerant Temperature control possible.
 - Y-control is possible (up to 3x [EKEQV+EKEQFA* boxes] can be connected to one outdoor unit (system)). No Variable Refrigerant Temperature control possible.
 - W-control is possible (up to 3x [EKEQV+EKEQFA* boxes] can be connected to one outdoor unit (system)). No Variable Refrigerant Temperature control possible.
 - Combination of AHU only + control box EKEQMA (not combined with VRV DX indoor units)
 - Z-control is possible (the allowed number of [EKEQV + EKEQMA boxes] is determined by the connection ratio (90-110%) and the capacity of the outdoor unit).
- Combination of AHU and VRV DX indoor units
 - Z-control is possible (EKEQMA* boxes are allowed, but with a limited connection ratio).
- The combination of AHU with Hydrobox units or RA DX indoor units is not allowed.
- (3) The following units are considered AHUs:
 - EKEQV + EKEQ(MA/FA) + AHU coil
 - Biddle air curtain
 - FXMQ_MF units

Information

- VKM units are considered to be regular VRV DX indoor units.

4 Combination table

4 - 1 Combination Table

RXMLQ-T

RXYLQ-T

Unit combination restrictions: VRV4 outdoor units (all models) + 15-class indoor units

Units in scope: FXZQ15A and FXAQ15A.

1. In case the system contains these indoor units and the total connection ratio (CR) $\leq 100\%$: no special restrictions.
Follow the restrictions that apply to regular VRV DX indoor units.
2. In case the system contains these indoor units and the total connection ratio (CR) $> 100\%$: special restrictions apply.
 - A. When the connection ratio (CR1) of the sum of all FXZQ15A and/or FXAQ15A units in the system $\leq 70\%$, and ALL other VRV DX indoor units have an individual capacity class > 50 : no special restrictions.
 - B. When the connection ratio (CR1) of the sum of all FXZQ15A and/or FXAQ15A units in the system $\leq 70\%$, and NOT ALL other VRV DX indoor units have an individual capacity class > 50 : the restrictions below apply.
 - $100\% < CR \leq 105\% \rightarrow$ CR1 of the sum of all FXZQ15A and/or FXAQ15A indoor units in the system must be $\leq 70\%$.
 - $105\% < CR \leq 110\% \rightarrow$ CR1 of the sum of all FXZQ15A and/or FXAQ15A indoor units in the system must be $\leq 60\%$.
 - $110\% < CR \leq 115\% \rightarrow$ CR1 of the sum of all FXZQ15A and/or FXAQ15A indoor units in the system must be $\leq 40\%$.
 - $115\% < CR \leq 120\% \rightarrow$ CR1 of the sum of all FXZQ15A and/or FXAQ15A indoor units in the system must be $\leq 25\%$.
 - $120\% < CR \leq 125\% \rightarrow$ CR1 of the sum of all FXZQ15A and/or FXAQ15A indoor units in the system must be $\leq 10\%$.
 - $125\% < CR \leq 130\% \rightarrow$ FXZQ15A and FXAQ15A cannot be used

REMARK

Only the 15-class indoor units explicitly mentioned on this page are in scope. Other indoor units follow the rules that apply to regular VRV DX indoor units.

5 Capacity tables

5 - 1 Capacity Table Legend

In order to fulfill more your requirements on quick access of data in the format you require, we have developed a tool to consult capacity tables.

Below you can find the link to the capacity table database and an overview of all the tools we have to help you select the correct product:

- **Capacity table database:** lets you find back and export quickly the capacity information you are looking for based upon unit model, refrigerant temperature and connection ratio.
- You can access the capacity table viewer here:
https://my.daikin.eu/content/denv/en_US/home/applications/software-finder/capacity-table-viewer.html

- An overview of **all software tools** that we offer can be found here:
https://my.daikin.eu/denv/en_US/home/applications/software-finder.html

5 Capacity tables

5 - 2 Capacity Correction Factor

RXMLQ-T
RXYLQ-T

•VRV• Cold region heat pump
Integrated Heating Capacity coefficient

The heating capacity tables do not take account of the reduction in capacity, when frost has accumulated or while the defrosting operation is in progress. The capacity values, which take these factors into account, in other words, the integrated heating capacity values, can be calculated as follows:

Formula:

Integrated heating capacity = **A**
Value given in table of capacity characteristics = **B** Integrating
correction factor for frost accumulation (kW) = **C A = B * C**

Inlet air temperature of heat exchanger

[°CDB/°CWB]	-7/-7,6 or less	-5/-5,6	-3/-3,7	0/-0,7	3/2,2	5/4,1	7/6
Correction factor defrost	0,95	0,90	0,90	0,90	0,90	0,95	1,00

Notes

- 1) The figure shows that the integrated heating capacity expresses the integrated capacity for a single cycle (from defrost operation to defrost operation) in terms of time.
- 2) Note that, when there is an accumulation of snow against the outside surface of the outdoor unit heat exchanger, there will always be a temporary reduction in capacity, although this will of course vary in degree in accordance with a number of other factors, such as the outdoor temperature (°CDB), relative humidity (RH) and the amount of frosting which occurs.
- 3) Multi combination data is corresponding with the standard multi combination as mentioned on 3D117167.

3D117196

RXMLQ8T

Notes

1. These figures illustrate the capacity correction factor due to the piping length for a standard indoor unit system at maximum load (with the thermostat set to maximum), under standard conditions. Moreover, under partial load conditions, there is only a minor deviation for the capacity correction ratio, as shown in the above figures.
2. With this outdoor unit, the following control is used:
- in case of cooling: constant evaporating pressure control
- in case of heating: constant condensing pressure control
3. Method of calculating the capacity of the outdoor units.
The maximum capacity of the system will be either the total capacity of the indoor units or the maximum capacity of the outdoor units as mentioned below, whichever is less.

Condition Indoor connection ratio ≤ 100%.

Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at 100% connection ratio.
x Correction ratio of piping to furthest indoor unit

Condition Indoor connection ratio > 100%.

Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at installed connection ratio.
x Correction ratio of piping to furthest indoor unit

4. When the level difference is 50 m or more and the equivalent piping length is 90 m or more, the diameter of the main gas and liquid pipes (outdoor unit - branch sections) must be increased.
Refer to installation manual - 3D079540 / 3D79543.
For the new diameters, see below.

Model	Gas pipe	Liquid pipe
8HP	22,2	12,7

5. When the pipe length after the first refrigerant branch kit is more than 40 m, the pipe size between the first and the final branch kit must be increased (only for VRV DX indoor units).
For details, see the installer reference guide.

* See the installation manual for allowed system setups and the rules for dedicated indoor connection types.

Equivalent piping length [m]

Diameter of the main pipes (standard size)

Model	Gas pipe	Liquid pipe
8HP	19,1	9,5

6. The equivalent lengths from the graphs above were obtained with the following calculation:

$$\frac{\text{Equivalent piping length [m]}}{\text{Equivalent length of the main pipe}} + \frac{\text{Equivalent length of the branch pipes}}{\text{Correction factor}}$$

Choose the correction factor from the following table.

When calculating the cooling capacity: gas pipe size
When calculating the heating capacity: liquid pipe size

	Correction factor	
	Standard size	Size increase
Cooling (gas pipe)	1,0	0,5
Heating (liquid pipe)	1,0	0,5

Example

Cooling Overall equivalent length = 80m x 0,5 + 40m = 80m
Heating Overall equivalent length = 80m x 0,5 + 40m = 80m

The change rate of the cooling capacity when the height difference = 0 is about -0,86%
The change rate of the heating capacity when the height difference = 0 is about -1,0%

3D108958B

5 Capacity tables

5 - 2 Capacity Correction Factor

RXYLQ10T

Notes

- These figures illustrate the capacity correction factor due to the piping length for a standard indoor unit system at maximum load (with the thermostat set to maximum), under standard conditions. Moreover, under partial load conditions, there is only a minor deviation for the capacity correction ratio, as shown in the above figures.
- With this outdoor unit, the following control is used:
 - in case of cooling: constant evaporating pressure control
 - in case of heating: constant condensing pressure control
- Method of calculating the capacity of the outdoor units.**
The maximum capacity of the system will be either the total capacity of the indoor units or the maximum capacity of the outdoor units as mentioned below, whichever is less.

Conditions Indoor connection ratio ≤ 100%.

Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at 100% connection ratio.
x Correction ratio of piping to furthest indoor unit

Conditions Indoor connection ratio > 100%.

Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at installed connection ratio.
x Correction ratio of piping to furthest indoor unit

- When the level difference is 50 m or more and the equivalent piping length is 90 m or more, the diameter of the main gas and liquid pipes (outdoor unit - branch sections) must be increased. Refer to installation manual 3D079540 / 3D079543. For the new diameters, see below.

Model	Gas pipe	Liquid pipe
10HP	25,4"	12,7"

* If not available on-site, do not increase the piping diameter.

* If not increased, do not apply a correction factor to the equivalent piping length (see note -6).

- When the pipe length after the first refrigerant branch kit is more than 40 m, the pipe size between the first and the final branch kit must be increased (only for VRV DX indoor units). For details, see the installer reference guide.

* See the installation manual for allowed system setups and the rules for dedicated indoor connection types.

Equivalent piping length [m]

Diameter of the main pipes (standard size)

Model	Gas pipe	Liquid pipe
10HP	22,2	9,5

- The equivalent lengths from the graphs above were obtained with the following calculation:

Equivalent piping length [m] =

Equivalent length of the main pipe x Correction factor

+ Equivalent length of the branch pipes

Choose the correction factor from the following table.

When calculating the cooling capacity: gas pipe size
When calculating the heating capacity: liquid pipe size

	Correction factor	
	Standard size	Size increase
Cooling (gas pipe)	1,0	0,5
Heating (liquid pipe)	1,0	0,5

Example

Cooling Overall equivalent length = 80m x 0,5 + 40m = 80m
Heating Overall equivalent length = 80m x 0,5 + 40m = 80m

The change rate of the cooling capacity when the height difference = 0 is about -0,87.
The change rate of the heating capacity when the height difference = 0 is about -0,90.

Notes

- These figures illustrate the capacity correction factor due to the piping length for a standard indoor unit system at maximum load (with the thermostat set to maximum), under standard conditions. Moreover, under partial load conditions, there is only a minor deviation for the capacity correction ratio, as shown in the above figures.

- With this outdoor unit, the following control is used:
 - in case of cooling: constant evaporating pressure control
 - in case of heating: constant condensing pressure control

- Method of calculating the capacity of the outdoor units.**

The maximum capacity of the system will be either the total capacity of the indoor units or the maximum capacity of the outdoor units as mentioned below, whichever is less.

Conditions Indoor connection ratio ≤ 100%.

Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at 100% connection ratio.
x Correction ratio of piping to furthest indoor unit

Conditions Indoor connection ratio > 100%.

Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at installed connection ratio.
x Correction ratio of piping to furthest indoor unit

- When the level difference is 50 m or more and the equivalent piping length is 90 m or more, the diameter of the main gas and liquid pipes (outdoor unit - branch sections) must be increased. Refer to installation manual 3D079540 / 3D079543. For the new diameters, see below.

Model	Gas pipe	Liquid pipe
12HP	28,6	15,9
14HP	28,6	15,9
24HP	34,9	19,1
36HP	41,3	22,2

- When the pipe length after the first refrigerant branch kit is more than 40 m, the pipe size between the first and the final branch kit must be increased (only for VRV DX indoor units). For details, see the installer reference guide.

* See the installation manual for allowed system setups and the rules for dedicated indoor connection types.

Diameter of the main pipes (standard size)

Model	Gas pipe	Liquid pipe
12HP	28,6	12,7
14HP	28,6	12,7
24HP	34,9	15,9
36HP	41,3	19,1

- The equivalent lengths from the graphs above were obtained with the following calculation:

Equivalent piping length [m] =

Equivalent length of the main pipe x Correction factor

+ Equivalent length of the branch pipes

Choose the correction factor from the following table.

When calculating the cooling capacity: gas pipe size
When calculating the heating capacity: liquid pipe size

	Correction factor	
	Standard size	Size increase
Cooling (gas pipe)	1,0	0,5
Heating (liquid pipe)	1,0	0,5

Example

Cooling Overall equivalent length = 80m x 1,0 + 40m = 120m
Heating Overall equivalent length = 80m x 0,5 + 40m = 80m

The change rate of the cooling capacity when the height difference = 0 is about -0,89.
The change rate of the heating capacity when the height difference = 0 is about -1,0.

5 Capacity tables

5 - 2 Capacity Correction Factor

RXYLQ16T

Notes

- These figures illustrate the capacity correction factor due to the piping length for a standard indoor unit system at maximum load (with the thermostat set to maximum), under standard conditions.
Moreover, under partial load conditions, there is only a minor deviation for the capacity correction ratio, as shown in the above figures.

- With this outdoor unit, the following control is used:
- in case of cooling: constant evaporating pressure control
- in case of heating: constant condensing pressure control

- Method of calculating the capacity of the outdoor units.
The maximum capacity of the system will be either the total capacity of the indoor units or the maximum capacity of the outdoor units as mentioned below, whichever is less.

Conditions Indoor connection ratio ≤ 100%.
Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at 100% connection ratio.
x Correction ratio of piping to furthest indoor unit

Conditions Indoor connection ratio > 100%.
Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at installed connection ratio.
x Correction ratio of piping to furthest indoor unit

- When the level difference is 50 m or more and the equivalent piping length is 90 m or more, the diameter of the main gas and liquid pipes (outdoor unit - branch sections) must be increased.
Refer to installation manual 30079540 / 3079543.
For the new diameters, see below.

Model	Gas pipe	Liquid pipe
16HP	31.8 *	15.9

* If not available on-site, do not increase the piping diameter.
* If not increased, do not apply a correction factor to the equivalent piping length (see note 6).

- When the pipe length after the first refrigerant branch kit is more than 40 m, the pipe size between the first and the final branch kit must be increased (only for VRV DX indoor units).
For details, see the installer reference guide.

* See the installation manual for allowed system setups and the rules for dedicated indoor connection types.

Diameter of the main pipes (standard size)

Model	Gas pipe	Liquid pipe
16HP	28.6	12.7

- The equivalent lengths from the graphs above were obtained with the following calculation:

$$\text{Equivalent piping length (m)} = \text{Equivalent length of the main pipe} \times \text{Correction factor} + \text{Equivalent length of the branch pipes}$$

Choose the correction factor from the following table.

When calculating the cooling capacity: gas pipe size
When calculating the heating capacity: liquid pipe size

	Correction factor	
	Standard size	Size increase
Cooling (gas pipe)	1.0	0.5
Heating (liquid pipe)	1.0	0.5

Example

Cooling Overall equivalent length = 80m x 0.5 + 40m = 80m
Heating Overall equivalent length = 80m x 0.5 + 40m = 80m

The change rate of the cooling capacity when the height difference = 0 is about -0.88
The change rate of the heating capacity when the height difference = 0 is about -0.99

Notes

- These figures illustrate the capacity correction factor due to the piping length for a standard indoor unit system at maximum load (with the thermostat set to maximum), under standard conditions.
Moreover, under partial load conditions, there is only a minor deviation for the capacity correction ratio, as shown in the above figures.

- With this outdoor unit, the following control is used:
- in case of cooling: constant evaporating pressure control
- in case of heating: constant condensing pressure control

- Method of calculating the capacity of the outdoor units.
The maximum capacity of the system will be either the total capacity of the indoor units or the maximum capacity of the outdoor units as mentioned below, whichever is less.

Conditions Indoor connection ratio ≤ 100%.
Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at 100% connection ratio.
x Correction ratio of piping to furthest indoor unit

Conditions Indoor connection ratio > 100%.
Maximum capacity of outdoor units = Capacity of outdoor units from capacity table at installed connection ratio.
x Correction ratio of piping to furthest indoor unit

- When the level difference is 50 m or more and the equivalent piping length is 90 m or more, the diameter of the main gas and liquid pipes (outdoor unit - branch sections) must be increased.
Refer to installation manual 30079540 / 3079543.
For the new diameters, see below.

Model	Gas pipe	Liquid pipe
18HP	31.8 *	19.1
26~30HP	38.1 *	22.2
38~42HP	41.3	22.2

* If not available on-site, do not increase the piping diameter.
* If not increased, do not apply a correction factor to the equivalent piping length (see note 6).

- When the pipe length after the first refrigerant branch kit is more than 40 m, the pipe size between the first and the final branch kit must be increased (only for VRV DX indoor units).
For details, see the installer reference guide.

* See the installation manual for allowed system setups and the rules for dedicated indoor connection types.

Diameter of the main pipes (standard size)

Model	Gas pipe	Liquid pipe
18HP	28.6	15.9
26~30HP	34.9	19.1
38~42HP	41.3	19.1

- The equivalent lengths from the graphs above were obtained with the following calculation:

$$\text{Equivalent piping length (m)} = \text{Equivalent length of the main pipe} \times \text{Correction factor} + \text{Equivalent length of the branch pipes}$$

Choose the correction factor from the following table.

When calculating the cooling capacity: gas pipe size
When calculating the heating capacity: liquid pipe size

	Correction factor	
	Standard size	Size increase
Cooling (gas pipe)	1.0	0.5
Heating (liquid pipe)	1.0	0.5

Example

Cooling Overall equivalent length = 80m x 1.0 + 40m = 120m
Heating Overall equivalent length = 80m x 0.5 + 40m = 80m

The change rate of the cooling capacity when the height difference = 0 is about 0.83
The change rate of the heating capacity when the height difference = 0 is about 1.0

		Maximum piping length			Maximum height difference			Total piping length
		Longest pipe (A+{B,G,E,J}) Actual / (Equivalent)	After first branch (B,G,E,J) Actual	After first branch (for multi-outdoor) (D) Actual / (Equivalent)	Indoor-to-outdoor (H1) Outdoor above indoor / (indoor above outdoor)	Indoor-to-indoor (H2)	Outdoor-to-outdoor (H3)	
Standard		(8)						
VRV DX indoor units only		165/(190)m	40m ⁽¹⁾	10/(13)m	50/(40)m ⁽³⁾	30m	5m	500m
Standard multi-combination								
All multi-outdoor-unit combinations except standard multi-outdoor-unit combinations		135/(160)m ⁽⁸⁾	40m ⁽¹⁾	10/(13)m	50/(40)m ⁽³⁾	30m	5m	300m
Hydrobox connection		135/(160)m ⁽⁸⁾	40m	10/(13)m	50/(40)m	15m	5m	300m ⁽⁶⁾
RA connection		100/(120)m ⁽⁸⁾	50m ⁽²⁾	-	50/(40)m	15m	-	250m
AHU connection	Pair	50/(55)m ⁽⁶⁾	-	-	40/(40)m	-	-	-
	Multi ⁽⁶⁾	120/(140)m ⁽⁸⁾	40m	10/(13)m	40/(40)m	15m	-	500m
	Mix ⁽⁷⁾	120/(140)m ⁽⁸⁾	40m	10/(13)m	40/(40)m	15m	5m	500m

Remark

For standard multi-outdoor-unit combinations, see 3D117167.

- (1) If all conditions below are met, the limitation can be extended up to 90 m.
 - a. The piping length between all indoor units and the nearest branch kit is ≤ 40m.
 - b. It is necessary to increase the size of the gas and liquid piping.
If the increased pipe size is larger than the pipe size of the main pipe, also increase the size of the main pipe.
 - c. When the piping size is increased, the piping length has to be counted as double.
 - d. The total piping length has to be within limitations.
- (2) The piping length difference between the nearest indoor unit from the first branch to the outdoor unit and the farthest indoor unit to the outdoor unit is ≤ 40m.
- (3) If the piping length between the first branch and the BP box or VRV indoor unit is more than 20m, increase the length of the gas and liquid piping between the first branch and the BP box or VRV indoor unit.
- (4) An extension to up to 90 m is possible without an additional option kit. Respect the following conditions:
 - > If the outdoor units are positioned higher than the indoor units:
 - a. Size up the liquid piping
 - b. A dedicated setting on the outdoor unit is required.
 - > If the outdoor units are positioned lower than the indoor units:
 - a. 40°E Minimum connection ratio: 80%
 - 60°E Minimum connection ratio: 90%
 - 65°E Minimum connection ratio: 100%
 - 80°E Minimum connection ratio: 110%
 - b. Size up the liquid piping
 - A dedicated setting on the outdoor unit is required.
- (5) The allowable minimum length is 5 m.
- (6) In case of multi-outdoor-unit combinations.
- (7) Multiple air handling units (AHU)(EKEV + EKEQ kits).
- (8) Mix of AHU units and VRV DX indoor

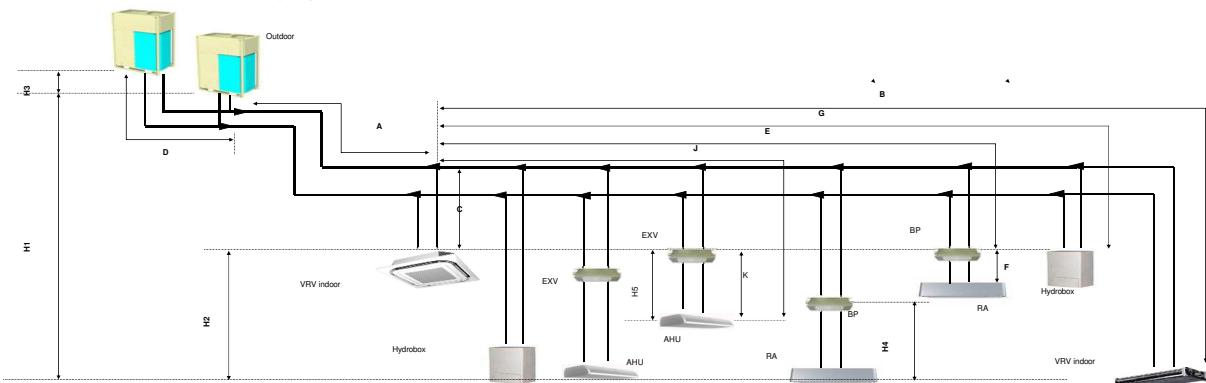

(8) If the equivalent piping length between is > 90m, size up the main liquid and gas piping.

Piping restrictions 3/3

System pattern Allowed connection ratio (CR) Other combinations are not allowed.	Total		Allowed capacity			
	Capacity	Indoor unit quantity (VRV, RA, AHU, Hydrobox)	VRV DX indoor unit	RA DX indoor unit	Hydrobox unit	Air handling unit (AHU)
VRV DX indoor units only	70~130%	Max.64	70~130%	-	-	-
VRV DX indoor unit + RA DX	80~130%	Max.32 ⁽¹⁾	0~130%	0~130%	-	-
RA DX indoor unit	80~130%	Max.32 ⁽¹⁾	-	80~130%	-	-
VRV DX indoor unit + LT hydrobox	70~130%	Max.32	70~130%	-	0~50%	-
VRV DX indoor unit + AHU	70~110% ⁽³⁾	Max.64 ⁽²⁾	70~110%	-	-	0~110%
AHU only Pair + multi (4)	90~110% ⁽³⁾	Max.64 ⁽²⁾	-	-	-	90~110%

Remark

- (1) There is no restriction on the number of connectable BP boxes.
- (2) For connection with AHU
EKEXV kits are also considered indoor units.
- (3) Restrictions regarding the air handling unit capacity
- (4) Pair AHU = system with 1 air handling unit connected to one outdoor unit
Multi AHU = system with multiple air handling units connected to one outdoor unit

About ventilation applications

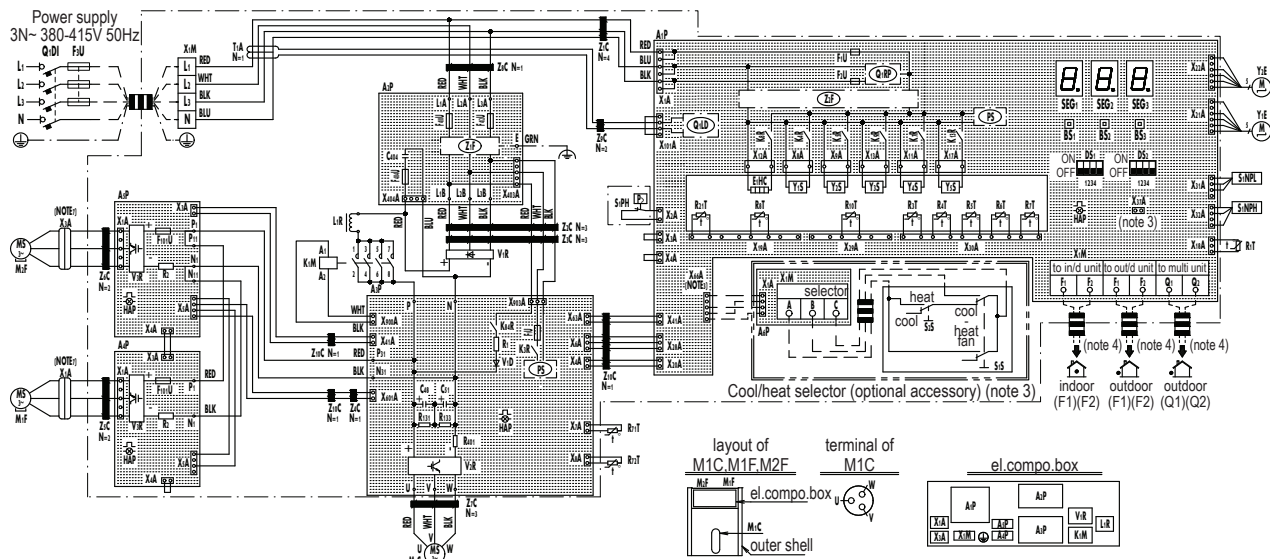

- I. FXMQ_MF units are considered air handling units, following air handling unit limitations.
Maximum connection ratio when combined with VRV DX indoor units: <30%.
Maximum connection ratio when only air handling units are connected: <100%.
For information on the operation range, refer to the documentation of the FXMQ_MF unit.
- II. Biddle air curtains are considered air handling units, following air handling unit limitations:
For information on the operation range, refer to the documentation of the Biddle unit.
- III. [EKEXV + EKEQ] units combined with an air handling unit are considered air handling units, following air handling unit limitations.
For information on the operation range, refer to the documentation of the EKEXV-EKEQ unit.
- IV. VKM units are considered to be regular VRV DX indoor units.
For information on the operation range, refer to the documentation of the VKM unit.
- V. Because there is no refrigerant connection with the outdoor unit (only communication F1/F2), VAM units do not have connection limitations.
However, since there is communication via F1/F2, count them as regular indoor unit when calculating the maximum allowed number of connectable indoor units.

9 Wiring diagrams

9 - 1 Wiring Diagrams - Three Phase

RXMLQ-T, RXYLQ-T

A1P	Printed circuit board (main)	R3T	Thermistor (suction)
A2P	Printed circuit board (noise filter)	R4T	Thermistor (heat exc, liq, main)
A3P	Printed circuit board (inv)	R5T	Thermistor (subcool, heat exc, liq)
A4P, A5P	Printed circuit board (fan)	R6T	Thermistor (subcool, heat exc, gas)
A6P	Printed circuit board (ABC I/P)	R7T	Thermistor (heat exc, deicer)
BS1~3 (A1P)	Push button switch (mode, set, return)	R8T	Thermistor (compressor body)
C48, C51 (A3P)	Capacitor	R10T	Thermistor (subcool, heat exc, inl)
C404 (A2P)	Capacitor	R21T	Thermistor (discharge)
DS1~2 (A1P)	Dip switch	R71T	Thermistor (power modular)
E1HC	Crank case heater	R72T	Thermistor (rectifier bridge plate)
F1U, F2U (A1P)	Fuse (T, 3, 15A, 250V)	S1NPH	Pressure sensor (high)
F1U (A3P)	Fuse (T, 1A, 500V)	S1NPL	Pressure sensor (low)
F3U	Field fuse	S1PH	Pressure switch (disch)
F101U (A4P, A5P)	Fuse	SEG1~3 (A1P)	7-Segment display
F404U, F410U, F412U (A2P)	Fuse	T1A	Current sensor
HAP (A1P, A3P, A4P, A5P)	Pilotlamp (service monitor-green)	V1D (A3P)	Diode
K1M	Magnetic contactor	V1R	Power module
K3R (A3P)	Magnetic relay	V2R (A3P)	Power module
K4R (A1P)	Magnetic relay (Y1S)	V3R (A4P, A5P)	Power module
K5R (A1P)	Magnetic relay (Y2S)	X1A, X3A	Connector (M1F, M2F)
K7R (A1P)	Magnetic relay (Y4S)	X1M	Terminal block (power supply)
K8R (A1P)	Magnetic relay (E1HC)	X1M (A6P)	Terminal block (control)
K9R (A1P)	Magnetic relay (Y3S)	X*A (A*P)	Connector
K13R (A1P)	Magnetic relay (Y5S)	Y1E	Electronic expansion valve (main)
K84R (A3P)	Magnetic relay	Y2E	Electronic expansion valve (injection)
L1R	Reactor	Y1S	Solenoid valve (main)
M1C	Motor (compressor)	Y2S	Solenoid valve (accumulator oil return)
M1F, M2F	Motor (fan)	Y3S	Solenoid valve (oil1)
PS (A1P, A3P)	Switching power supply	Y4S	Solenoid valve (inj.)
Q1DI	Field earth leakage breaker	Y5S	Solenoid valve (hot gas)
Q1LD (A1P)	Earth leakage current detector	Z*C	Noise filter (ferrite core)
Q1RP (A1P)	Phase reversal detect circuit	Z1F (A2P)	Noise filter (with surge absorber)
R1 (A3P)	Resistor (current limiting)	Z2F (A1P)	Noise filter
R2 (A4P, A5P)	Resistor (current sensor)		Connector for optional accessories
R131, R133 (A3P)	Resistor	X37A	Connector (power adapter)
R401 (A3P)	Resistor (current sensor)	X66A	Connector (remote switching cool/heat selector)
R1T	Thermistor (air)		

NOTES

- This wiring diagram applies only to the outdoor unit.
- Field wiring, terminal block, connector, terminal, protective earth (screw), functional earth, earth wiring, field supply, PCB, switch box, options
- When using the optional adapter, refer to the installation manual of the optional adapter.
- For connection wiring from indoor-outdoor transmission F1-F2
- Outdoor-outdoor transmission F1-F2, outdoor-multi transmission Q1-Q2
- Refer to the installation manual.
- How to use BS1~3 switch. Refer to "service precaution" label on el. compo. box cover.
- When operating, don't shortcircuit the protection devices (S1PH).
- Connector X1A (M1F) is white, connector X3A (M2F) is red.

NOTES

1. All wiring, components and materials to be procured on the site must comply with the applicable local and national codes.
2. Use copper conductors only.
3. As for details, see wiring diagram.
4. Install circuit breaker for safety.
5. All field wiring and components must be provided by licensed electrician.
6. Unit shall be grounded in compliance with the applicable local and national codes.
7. Wiring shown are general points-of-connection guides only and are not intended for or to include all details for a specific installation.
8. Be sure to install the switch and the fuse to the power line of each equipment.
9. Install the main switch that can interrupt all the power sources in an integrated manner because this system consists of the equipment utilizing the multiple power sources.
10. If there exists the possibility of reversed phase, lose phase, momentary blackout or the power goes on and off while the product is operating, attach a reversed phase protection circuit locally. Running the product in reversed phase may break the compressor and other parts.
11. Must install earth leakage circuit breaker.

12 Installation

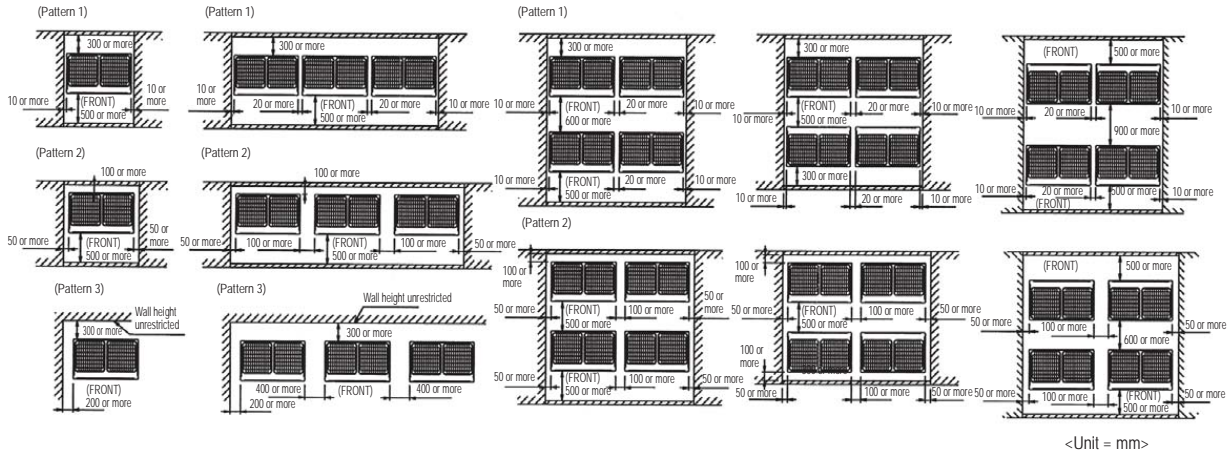

12 - 1 Installation Method

RXMLQ-T
RXYLQ-T

For single unit installation

For installation in rows

For centralized group layout

NOTES

- Heights of walls in case of patterns 1 and 2:
Front: 1500mm
Suction side: 500mm
Side: Height unrestricted
Installation space as shown on this drawing is based on the cooling operation at 35 degrees outdoor air temperature.
When the design outdoor air temperature exceeds 35 degrees or the load exceeds maximum ability of much generation load of heat in all outdoor unit, take the suction side space more broadly than the space as shown on this drawing.
- If the above wall heights are exceeded then h2/2 and h1/2 should be added to the front and suction side service spaces respectively as shown in the figure on the right.
- When installing the units most appropriate pattern should be selected from those shown above in order to obtain the best fit in the space available. Always keep in mind the need to leave enough space for a person to pass between units and wall and also for the air to circulate freely.
(If more units are to be installed than are catered for in the above patterns your layout should take account of the possibility of short circuits).
- The units should be installed to leave sufficient space at the front for the on site refrigerant piping work to be carried out comfortably.

13 Operation range

13 - 1 Operation Range

RXMLQ-T
RXYLQ-T

13

Heating

Notes

- These figures assume the following operation conditions
Indoor and outdoor units
Equivalent piping length: ·5·m
Level difference: ·0·m
- Depending on operation and installation conditions, the indoor unit can change over to freeze-up operation (indoor de-icing).
- To reduce the freeze-up operation (indoor de-icing) frequency, it is recommended to install the outdoor unit in a location not exposed to wind.
- Operation range is valid in case direct expansion indoor units are used.
If other indoor units are used, refer to the documentation of the respective indoor units.
