1 Technician Qualifications

Initial startup on Daikin chillers must be performed only by Daikin Service Technicians or Authorized Service Providers. The contents of this manual are not intended as a substitute for professional skills training, or knowledge and practice of industry standards. Additional literature will be required that is product and component specific, including: product Installation Manuals, Service Bulletins, selection data, system control and piping specifications, etc. (see List of References on *Paragraph 2* for a list of some supplemental items).

The following information is intended only as a guide for authorized personnel with a sound basic knowledge of HVAC equipment, mechanical systems, electrical wiring, controls, & microprocessors. Attempts by untrained or unauthorized persons to start, operate and service this equipment can result in equipment failure, personal injury, or death, as well as invalidation of product warranty. It is the responsibility of the technician to ensure that proper safety equipment safe practices are used.

Be sure that before beginning any work, the Startup Service Technician has reviewed and is thoroughly familiar with all Daikin Factory Service Safety Policies and Procedures and has reviewed any Service Bulletins or Rapid News regarding this product.

2 Required Tools and Supplies

In addition to standard tools needed on most service jobs, be sure to bring the following items to the jobsite for Startup:

- Personal Protective Equipment (Safety)
- Commissioning Sheet
- Chiller Technical Data, Selection Sheet, and Certified Submittal Drawings
- Manuals:

Note: Be sure that all manuals are the current revision appropriate for this unit.

- This Manual: Startup Guide – EWAD-TZD, EWAD-MZD, EWAH-TZD, EWAH-MZD, EWAS-TZD, EWFD-TZD, EWFS-TZD
- Installation, Operation and Maintenance Manual Air cooled chiller with inverter driven screw compressor (D-EIMAC01905-23_01EN)
- Control Manual: Air cooled chiller with inverter driven screw compressor (D-EOMAC01905-23_00EN)
- EWAD_TZ P&ID (last revision) – check in IOM Manual
- Wiring Diagram

INFORMATION

DAE TZ Family IOM and OM pdf documents, are available in different languages at the following public portal link: [Daikin Screw inverter EWAD\(H\)-TZ](#)

- Other technical reference material as necessary
- Current operating software version downloaded and ready to install if needed:
 - Last ETRA version available on official repository
- Miscellaneous gauges and hand tools, including:
 - Electronic Leak Detector
 - Differential Pressure Gauge (*adequate for system pressures*)
 - Phase Rotation Meter
 - Refrigeration Gauge Manifold (*Range: 50bar, Accuracy: ±0.5% of Final Value, Resolution: 0.01bar/0.1psi/1kPa*)
 - Digital thermometer (*Range: -50°C/+150°C, Accuracy: ±0.1°C, Resolution: 0.1°C*)
 - Amp probe
 - Voltmeters
 - Recover refrigerant cylinder (*for eventual charge adjustments*)

- Full refrigerant cylinder (*for eventual charge adjustments*)
- Recovery pump (*for eventual charge adjustments*)
- Siemens Remote Interface POL 895 (CE+, CE- connection) (Accessory EKRUPCS)

3 Collaboration and Responsibilities

Throughout the installation and startup process, members of the Daikin Service Department (Supervisor / Coordinator / Technician) must establish contact and meet regularly with the following persons and/or their designated representatives:

- Mechanical, Electrical, and Controls Contractors
- Installing Contractor
- Daikin Sales Department
- Customer/Owner
- Personnel to be trained in unit operation

It is the responsibility of the Daikin Service Representative to ensure that all items on the *Pre-Power On Checklist* are complete and the system is ready for start-up. Upon arrival at the jobsite, the DAIKIN Service technician will verify that all items on the *Pre-Power On Checklist* are complete.

The Chiller Start-up Technician must confirm that the unit installation conforms to Daikin specifications and requirements. This includes mounting and support, piping, electrical and control installations related to the unit. These items must, as a minimum, meet acceptable industry standards and Daikin published requirements. All factory supplied controls and valves must be set and, where required, calibrated. Electrical power and control wiring must be selected and sized as specified by Daikin and the applicable electrical code.

The various contractors associated with the installation have the responsibility to provide the following items (as noted on the Pre-Start Checklist), in accordance with the product IOM, applicable codes and acceptable practices for the trade involved. Note any discrepancies on Commissioning Sheet and notify Supervisor as appropriate. Ensure that access to appropriate systems is available for startup operations.

4 Before Arriving at Jobsite

- Review and Verify Pre-Commissioning Sheet received from the Installer/Customer (*Table D*) Company/Contractor.
- Review Required Materials List on (refer to paragraph 2) and gather necessary items.
- Review Unit Design Specifications.
- Review Unit Selection Sheet.
- Review Startup Guide and Commissioning Form.
- Review IOM.
- Review Control Manual.
- Establish estimated timeline and milestones for Startup.

5 Upon Arrival at Jobsite

Meet with Mechanical, Electrical, and Control Contractors to discuss Startup Process and identify any potential issues that may interfere with a successful startup.

Be sure to meet with the Controls Contractor to discuss and clarify the chiller control sequence and settings for the chiller, towers, pumps, BAS integration, etc...

6 Pre-Power on Checks

Initial Chiller Inspection has to be performed according to the **Pre-Power On Checklist** of the Commissioning Sheet by following the instruction below shown.

Verify that all the items are correct. If the system is not ready and/or items on the Pre-Power On Checklist are incomplete, the technician should immediately notify his supervisor and request direction on how to proceed. A separate work order authorization may be required.

6.1 Visual Inspection

- Inspect the chiller for shipping/installation damage including fans and internal parts of condenser.
- Verify that chiller is adequately located, and level mounted as per the IOM (**Paragraph 4.3**) according to the minimum space requirements (**Paragraph 4.4**)
- Verify that appropriate anti-vibration pads are installed.
- Visually inspect for oil and refrigerant leaks.
- Record component model and serial numbers as appropriate on Commissioning Form.
- Clean the chiller from any foreign debris and surrounding area.

Note any issues in the Commissioning Form (**Pre-Startup Comments**)

6.2 Leak Test

Before to start with Leak Test, verify that during stock period (from Delivery Date), leak tests have been performed periodically as per local FGas Regulation. Collect all leak test reports for recording purpose.

Connect service gauges. Confirm pressure in the condenser and evaporator, to verify that charge was not leaked during storage/shipping. Using Electronic Leak Detector, leak check entire unit. Be sure to note any leaks found and repairs performed on the Commissioning Sheet. Follow all applicable industry and regulatory authority standards. If refrigerant loss is catastrophic, startup may need to be postponed until appropriate warranty leak repairs are completed.

Note any issues in the Commissioning Form (**Pre-Startup Comments**)

6.3 Water Piping System Check

- Verify water piping as per IOM (**Paragraph 4.6**). The water filter must be installed as close as possible to the chiller, as in Figs. 8 and 9. If the water filter is installed in another part of the water system, the Installer has to guarantee the cleaning of the water pipes between the water filter and the evaporator. Missing filter results withdraw of heat-exchangers warranty.
- Verify if proper glycol percentage for the application in accordance with Daikin specifications is present as per IOM (Paragraph 3.3)
- Walk length of piping system (in equipment area). Ensure that connections are correctly installed, and piping is properly supported (i.e., not supported by the chiller). Flanges must not be stressed.
- Check evaporator piping for proper flow direction through vessels by consulting Dimensional Drawing. If flow is incorrect, notify Mechanical Contractor, Service Supervisor, and Sales Rep.
- Verify that water pressure gauges are installed at proper locations
- Confirm that all piping specialties (expansion tank, make-up, relief, vents, etc), water pumps are properly installed.

Note any issues in the Commissioning Form (**Pre-Startup Comments**)

6.4 Water Flow

Use Differential Pressure Gauge at the inlet/outlet nozzles of the unit connections to measure the pressure drop across the exchanger/exchangers.

Compare actual flow with Pressure Drop specified on the Unit Selection Sheet. Verify that actual flow is in line with the selection data.

If the measured flow isn't in line with the selection data, then refer to the CSS (Chiller Selection Software) for the verification of allowability of the measured water flow.

If flow is outside of acceptable margins, corrective action is required. If flow is too high, valves may be adjusted to trim flow. If flow is too low, notify Installing Contractor, and note on the Commissioning Form. If flow is different from the selection data, notify Service Supervisor and Sales Rep. Correction may be required prior to startup.

Note any issues in the Commissioning Form (**Pre-Startup Comments**)

6.4.1 Fixed speed control

Note: *The following procedure is not necessary in case of DT and VPF control*

Use Differential Pressure Gauge at the inlet/outlet nozzles of the unit connections to measure the pressure drop across the exchanger/exchangers.

Unit Mode → Test

Commission unit → Manual Control → Unit → Pump #

- Set *Pump 1 > On* to enable the Pump 1
- Fine tune the % speed to get Pressure Drop specified on the Chiller Selection Sheet
- Disable the pump when the correct speed is found: *Pump 1 > Off*

Go back to main menu to set the fixed speed value for the pump in running condition:

View/Set Unit → Pumps → Speed #1/#2

6.4.2 On-Off Control

Use Differential Pressure Gauge at the inlet/outlet nozzles of the unit connections to measure the pressure drop across the exchanger/exchangers.

Unit Mode → Test

Commission unit → Manual Control → Unit → Pump #

Compare current flow with Pressure Drop specified on the Chiller Selection Sheet. Verify that actual flow is in line with the selection data.

If flow is outside of acceptable margins, corrective action is required:

- If flow is too high, valves may be adjusted to trim flow.
- If flow is too low, notify Installing Contractor, and note on the Commissioning Form. If flow is different from the selection data, notify Service Supervisor and Sales Rep. Correction may be required prior to startup.

Disable the pump when the correct speed is found: *Pump 1 > Off*

6.4.3 VPF and DT control

Verify the Pump Mode settings in the menu

View/Set Unit → Pumps

For more information and settings about the Variable Primary Flow, refer to servicesupport@daikinapplied.eu

6.5 Electric Connections Check

- Verify the Electric connections, Cable requirements, Interconnection cables and Phase unbalance as per IOM.
- Verify the proper electrical phasing U-V-W of the loads (fans, compressors, and pumps) for L1, L2 and L3 respectively.
- Verify Field wiring correctness according to the unit wiring diagram

Field Wiring Connection				DAE_F03_001			
Type Signal description	Function	Page / column	Symbol	Type Signal description	Function	Page / column	Symbol
Analogic Input	4 to 20mA	25 5		Digital Output	UNIT ALARM Max Load 2A-230Vac External power supply	22 7	
Analogic Input	EVAPORATOR PRESSURE DROP 4 to 20mA	24 1		Digital Output	CONTROL EVAPORATOR WATER PUMP 1 Max Load 2A-230Vac External power supply	22 2	
Analogic Input	DEMAND LIMIT OR CURRENT LIMIT ENABLE 4 to 20mA	24 4		Digital Output	CONTROL EVAPORATOR WATER PUMP 2 Max Load 2A-230Vac External power supply	22 4	
Analogic Input	LWT RESET SET POINT OVERRIDE 4 to 20mA	24 1		Digital Output	READY TO START Max Load 2A-230Vac External power supply	23 1	
Analogic Output	HEAT RECOVERY 3 WAY VALVE 4 to 20mA	25 4		Digital Output	UNIT RUNNING Max Load 2A-230Vac External power supply	23 2	
Analogic Input	NTC10K or PT1000 probe	25 1		Digital Output	CONTROL HEAT RECOVERY PUMP Max Load 2A-230Vac External power supply	27 1	
Digital Input	UNIT START/STOP REMOTE	21 5		Digital Output	BYPASS VALVE Max Load 2A-230Vac External power supply	23 7	
Digital Input	EXTERNAL ALARM Remove Jumper	21 2		Digital Output	COMPRESSOR 1 STATUS Max Load 10A-230Vac External power supply	31 5	
Digital Input	DOUBLE SPEED PUMP SWITCH	21 3		Process bus	REMOTE DISPLAY OR MASTER/SLAVE COMMUNICATION Master/Slave bus connection	19 3	
Digital Input	DOUBLE SET POINT	21 4					
Digital Input	UPS BATTERY MODE Remove Jumper	26 3					
Digital Input	WCH FLOW SWITCH	24 2					

**External power supply needed for Digital output terminals
Analog Inputs must be generated through external auxiliary voltage**

Note any issues in the Commissioning Form (**Pre-Startup Comments**)

7 Pre-Startup Checks

Once the “**Pre-Power On Checks**” are completed, the technician can proceed with the Pre-Startup Checks by turning on the unit main switch.
Pre-Startup checks must be performed according to the **Pre-Startup Checklist** of the Commissioning Sheet by following the instruction below shown.

Make sure that unit switch (Q0) is set in OFF state before turning on the unit main switch

Verify that all the items are correct. If the system is not ready and/or items on the Pre-Startup Checklist are incomplete, the technician should immediately notify his supervisor and request direction on how to proceed. A separate work order authorization may be required.

7.1 Voltage Check

- Verify the electric Main voltage and frequency
- Verify all on-board auxiliary transformer voltages
- Check the Compressor Heater current

Note any issues in the Commissioning Form (**Pre-Startup Comments**)

7.2 Flow Switches

- Check the water flow safety switches: verify that field-installed flow switches are installed as per the manufacturer's instructions and IOM. (**Paragraph 4.6.3**)
- Any differential pressure switch connections must be made across the vessel they protect.
- Field-installed Flow switches should not be located close to any source of turbulence and should be located in inlet or outlet piping of the vessel away from any shutoff valves or isolation devices.
- Verify flow switches operation, by throttling the flow and verify that switch opens when flow rate falls below 50% of nominal operating flow rate.

Note any issues in the Commissioning Form (**Pre-Startup Comments**)

7.3 Control Settings

The following procedure must be done using POL 895 remote interface.

Authorized Service Technician must have POL 895 on field for service activities on EWxx-TZD and EWxx-MZD units

- Check all MicroTech IV controller settings to verify they are optimized for application conditions.
- Download and/or install updated software as needed.

INFORMATION

For more information about installing and updating software, refer to "SIEMENS CONTROLLER SOFTWARE UPDATE" Manual:

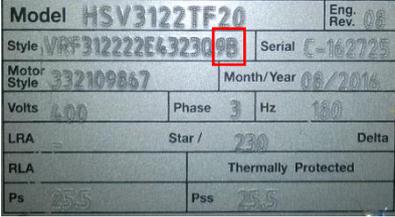

- **DENV affiliates** the manual is available on MyDaikin.eu in the product page of EWAD-TZ
- **DAE direct affiliates and distributors** the manual can be requested to DAE Service Support department

- Verify settings of all safety and operating controls.

7.3.1 Unit Configuration

On the unit controller, enter the "Technician Password" and go into Main Menu → Commission Unit → Configuration → Unit

Setpoint	Default	Range	Description
Apply Changes=	No	No Yes	Use this command to reset the controller in order to confirm the configuration made
Unit Type	TZ D	TZ D MZ D	Select the type of chiller. EWAXxxxTZxxD → EWAD TZ D EWADxxxMZxxD → EWAD MZ D
Refrigerant	R134A	R134A R1234ZE R513A	Select the type of refrigerant
Circuits	2	1 2	Define the number of circuits

Compressor	None	Not Set 310-240 S 310-240 L 310-199L F4AL	<p>Select the compressor model according to the machine model, referring to Unit configuration / compressor nameplates.</p> <p>Check that the compressor model is corresponding to the nameplate info, shown in the "Style" field on the compressor label.</p> 
Comp VR Type	Not Set	Not Set FT VVR Full Spec	<p>Select the VVR type (if present), refer to Unit configuration.</p> <p>If the compressor is FR or VVR select "FT VVR", if the compressor is Full Spec select "Full Spec"</p>
Motor	AC	AC DC	<p>Define the type of compressor motor by referring to Unit configuration</p>  <p>The DC Motor is indicated with a "B" on the compressor label</p>
Inverter Type	DAE	DAE	All production units are equipped with DAE Inverter
Inverter Size	200kW	90kW 120kW 200kW 330kW 400kW	Select the type of inverter installed on the compressor. Refer to Unit configuration
Fans Control	Step	Step Vfd SpdTrl	<p>Select whether the fans are Direct-start (On Off) or if they are controlled by inverter by referring to the electrical wiring of the unit.</p> <p>Step* = All fans are with direct start (On Off) VFD = All fans are controlled by Vfd Spdtrl = Only one fan is controlled by Vfd and all others are direct starting (On Off)</p> <p>Step fans are used only on EWAD-TZD Blue</p>
MB Fan Type	None	None Wolong Panasonic	Select the fan motor model if VFD or SpdTrl control is enable Refer to servicesupport@daikinapplied.eu for the Fan Type.
Fan Nom Rpm	1100	700..1100	Select the fan nominal speed in rpm, always set 1100
Fan Max Rpm	1100	700..1100	Select the fan nominal speed in rpm, referring to Unit configuration and the Standard column if the opt. Kit HA or 160 etc.. are not present
FC Max Rpm	950	700..1100	Select the fan nominal speed in rpm, referring to Unit configuration and the FC Max Rpm column, if the option Freecooling is present
Evap Type	BPHE	BPHE Spray	Select the Evaporator Type installed on the unit

After termination of the Unit configuration it's necessary to restart the controller to activate the settings made through the "Apply changes" command.

The control part of Micro-channel EWxx-TZD and EWxx-MZD machines is composed of the controller POL688 + one module Danfoss EKF-1A or EKF-2A (depending on whether the machine is Mono or Dual and other POL extension (POL945, POL 985, POL 965). Once the unit has been configured, after the controller has been restarted, a part of the program will automatically be transferred on the Danfoss EKF-1A or EKF-2A modules. Be careful not to remove the power supply if the LEDs of EKF-1A or EKF-2A modules have become green.

7.3.2 Circuit configuration

Technician Password → Commission Unit → Configuration → circuit #1/circuit #2

Setpoint	Default	Range	Description
Apply Changes=	No		No, Yes
Comp Freq	55 Hz	Compressor 310240 S: 60 Hz; 65 Hz; 70 Hz; 75 Hz; 80 Hz; 85 Hz; 90Hz; 95 Hz; 100 Hz; 105 Hz; 110 Hz; Compressor 310240 L: 60 Hz; 65 Hz; 70 Hz; 75 Hz; 80 Hz; 85 Hz; 90 Hz; 95 Hz; 100 Hz; 105 Hz; 110 Hz; Compressor F4AL VVR: 50 Hz; 55 Hz; 60 Hz; 65 Hz; 70 Hz; 75 Hz; 80 Hz; Compressor 310199L: 60; 65; 70; 75; 80; 85; 90	Select the maximum compressor frequency according to the machine model by referring to Unit configuration
Fans	-	... 10	Enter the number of fans present on the unit.
Heat Recovery OPT. (01, 03)	Disable	Disable Enable	Select whether the total heat recovery option, is present.

After termination of the circuit(s) configuration it's necessary to restart the controller to activate the settings made through the "Apply changes" command.

The control part of Micro-channel EWxx-TZD and EWxx-MZD machines is composed of the controller POL688 + one module Danfoss EKF-1A or EKF-2A (depending on whether the machine is Mono or Dual and other POL extension (POL945, POL 985, POL 965). Once the unit has been configured, after the controller has been restarted, a part of the program will automatically be transferred on the Danfoss EKF-1A or EKF-2A modules. Be careful not to remove the power supply if the LEDs of EKF-1A or EKF-2A modules have become green.

7.3.3 Options Configuration

Setpoint	Default	Range	Description
Apply Changes=	No		No, Yes
Evap Pump	On-Off	On-Off Fixed Speed VPF DT	Set the type of the pump <ul style="list-style-type: none"> Fixed Speed (OPT. 120 e-f-g-h) VPF – OPT.143 DT (OPT. 120 e-f-g-h)
Load PD Sns	None	None 0-10V 4-20mA BMS	Set the type of input for pressure drop measure on the plant (OPT.144) In case of option 144 the signal is 0-10 V.
Power Supply	400V/50-60Hz	400V/50-60Hz 415V/50Hz 440V/60Hz	Define the voltage grid system: this will determine the undervoltage/overvoltage supervision managed by the compressor inverter

		460V/60Hz 380V/50-60Hz	
Energy Mtr OPT.16A	None	None Nemo D4-L Nemo D4-Le	Select the type of energy meter device in case present  Nemo D4-L  Nemo D4-Le
Leak Detector OPT.121A	None	None Digital Analog	Select the type of leak detector device in case present.
Communication 1/2/3	None	None Modbus Bacnet IP (EKCBACIP) Bacnet MSTP (EKCBACMSTP) Lon (EKCLON) AWM	Select if there is the communication module connected on the left side of the controller. <ul style="list-style-type: none"> • Modbus = POL902.00 – Communication module Modbus (OPT. 180) • Bacnet IP = POL908.00 – Communication module BACnet IP (OPT. 182) • Bacnet MSTP = POL904.00 – Communication module BACnet MS/TP (OPT.181) • LON = POL906.00 – Communication module LON • AWM = POL909.00 – Communication Module AWM
Demand Limit OPT. 90	Disable	Disable Enable	Select this option if OPT.90 is present
Flex Current Limit	Disable	Disable Enable	
Setpoint Reset OPT.67	None	None 4-20mA Return OAT	In case of setpoint reset request, select on the basis of which sensor the reset will be carried out 4-20 mA → External sensor Return → EEWT temp sensor OAT → Unit outside air temp sensor
Fan Alarm	No	No Yes	Select this option if the KQ1 and KQ2 relays are present in the electrical panel
Switch Box Temp OPT.142	No	No Yes	Select if the switch box temperature probe is present. (HA units)
Rapid Restart OPT. 110	Off	Off Std Ultra	Enabling the Rapid Restart Function. Check if the option is available on the unit
Rapid Restart Stg	NC	NC NO	Select the contact type of the Rapid Restart
Ext Alarm OPT. 90	Event	Event Rapid Stop	Set according to the client request
Loc Net Switch	No	No Yes	Set according to the client request
M/S Address OPT.128	None	None Master Slave 1...7	Enabling of the Master & Slave feature
M/S Num Of Units OPT.128	2	2 3 4	Set according to the number of units in Master & Slave system
M/S Sns Type OPT.128	NTC10K	None NTC10K PT1000	Select the type of sensor for the common water temperature sensor
Display Units	Metric	Metric English	Set according to the client request
Language	English	-	Set according to the client request
Liquid Sensors	Standard	Standard Full	Select Standard if on the liquid line is present the temperature sensor Select Full if on the liquid line is present the temperature sensor and pressure transducer sensor
Solenoid valve	Off	Off On	Select On if anti chattering system is present
Freecooling	No	No Hydr	Select Hydr for EWF* units with freecooling system
High Evap Sp OPT.187	No	No Yes	Select if opt 187 (envelope extension) is present
OATLock Alarm	Off	Off On	
Harmonic Filter OPT.232	Off	Off On	Select On if the option AHF (Armonic Active Filter / Special Harmonic Filter) is present
Apply Changes	No	No Yes	Use this setting to save and confirm all the settings

After termination of the Unit configuration it's necessary to restart the controller to activate the settings made through the "Apply changes" command.

The control part of Micro-channel EWxx-TZD and EWxx-MZD machines is composed of the controller POL688 + one module Danfoss EKF-1A or EKF-2A (depending on whether the machine is Mono or Dual and other POL extension (POL945, POL 985, POL 965). Once the unit has been configured, after the controller has been restarted, a part of the program will automatically be transferred on the Danfoss EKF-1A or EKF-2A modules. Be careful not to remove the power supply if the LEDs of EKF-1A or EKF-2A modules have become green.

CAUTION

**Solenoid valve setting: This parameter is used to configure the anti-chattering system in the software*

After the apply changes function, verify the activation of the Solenoid Valve in the following menus

*View/Set Circuit > Circuit ½ > Economizer > Sol Valve > **With***

The parameter must be set "With". In case the parameter is "Without", change to "With"

7.3.4 Software Options

Software Options (Only for Microtech 4)

The possibility to employ a set of software options has been added to the functionality of the chiller, in according with the new Microtech 4 installed on the Unit. The Software Options do not require any additional hardware and regard communication channels and the new energy functionalities.

During the commissioning the machine is delivered with the Option Set chosen by the customer; the Password inserted is permanent and depends on the Serial Machine Number and the Option Set selected.

The available options are:

1. Modbus Slave MSTP for settings refer to BAS integration guide Doc. Name: D-EIGOC00203-21EN_TZ
2. BACNet MSTP for settings refer to BAS integration guide Doc. Name: D-EIGOC00103-21EN-TZ
3. BACNet IP for settings refer to BAS integration guide Doc. Name: D-EIGOC00103-21EN-TZ
4. Performance Monitoring. The Energy Monitoring is a software option not requiring any additional hardware. It can be activated to achieve an estimation (5% accuracy) of the instantaneous performances of the chiller in terms of:
 - Cooling Capacity
 - Power Input
 - Efficiency-COPAn integrated estimation of these quantities is provided

5. iCM Standard for settings and configuration, refer to the IOM
6. iCM Advanced for settings and configuration contact servicesupport@daikinapplied.eu

After termination of the Software Options configuration it's necessary to restart the controller to activate the settings made through the "Apply changes" command.

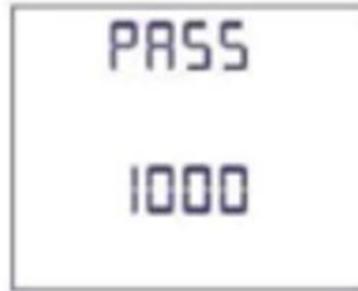

The control part of Micro-channel EWxx-TZD and EWxx-MZD machines is composed of the controller POL688 + one module Danfoss EKF-1A or EKF-2A (depending on whether the machine is Mono or Dual and other POL extension (POL945, POL 985, POL 965). Once the unit has been configured, after the controller has been restarted, a part of the program will automatically be transferred on the Danfoss EKF-1A or EKF-2A modules. Be careful not to remove the power supply if the LEDs of EKF-1A or EKF-2A modules have become green.

7.4 Fan layout

The image below shows the activation layout of the unit's fans. The number inside the single rectangle indicates the fan activation digital output and the rectangle indicates the septa into which the circuit is divided

Access the setup menu

- 1) Press "EPFF" repeatedly until the page is displayed : "ndb5"
- 2) Press and hold the "EPFF" button until you see the page: "PASS"
- 3) Enter the password "1000" and confirm with the "EPFF" button

The "arrow" ► is used to move between the various digits, while ▲▼ is used to increment or decrement the numerical value of each digit. The ENTER key is used to confirm the password.

Depending on the wiring configuration, the respective programming scheme must be selected.

- 1) Log in with the password "1000"
- 2) Press the "EPFF" button repeatedly until the page is displayed: "SYS"
- 3) Select the desired configuration: **3-2e** if the number of current transformers is 2, which is the standard configuration.

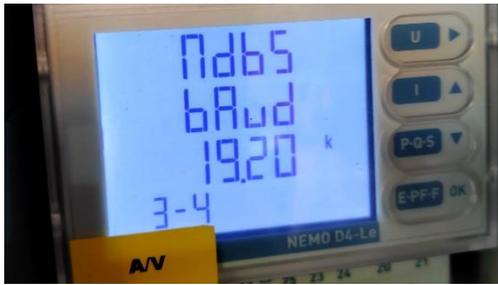

In case the energy meter is integrated with the Modbus communication network of the POL688 controller of the chiller unit, the Modbus parameters of the Nemo energy meter needs to be updated. It will be necessary to configure the address, transmission speed and parity bit on the energy meter corresponding to those on the chiller controller (POL688)

- 1) Log in with the password "1000"
- 2) Press "EPFF" repeatedly until the page is displayed: "MDB Addr"
- 3) Select Address **20**

- 4) Press "EPFF" repeatedly until the page is displayed "MDB Baud"
- 5) Select the baud rate **19200**

- 6) Press "EPFF" repeatedly until the page is displayed: "MDB par"
- 7) Select **None** Parity bit

- 8) Press "EPFF" repeatedly until the page is displayed "SAVE"

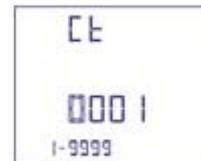

Set the transformation ratio of the current transformers (CT ratio)

On the label of the CT it's indicated what the maximum primary and secondary currents are.
 For example max primary current 1250A / max secondary current 5A gives an CT ratio of 250 (1250/5)

 moves the cursor
 increases/decreases the loaded value
 confirms

The nominal current value at the Ime Nemo Energy meter input terminals should be between 1A~5A. Do not use CT's that exceed this range in order to avoid damage to the energy meter!

7.8 Pre-Running Adjustments

Pre-Running Adjustments must be separately performed for each circuit

It is highly recommended to use a double sample sensor for the calibration of temperature sensors

7.8.1 Check and calibration of unit temperature sensors

Calibration of unit temperature sensors is a fundamental step for the correct operation of the unit.
 There are three temperature sensors to be calibrated (for each circuit):

- Evaporator LWT

- Evaporator EWT
- OAT

7.8.1.1 Evaporator Leaving Water Temperature

- Place the sample and Evap LWT sensors in a container with ice
- Enter in *Commission Unit* → *Sensors Calibration* → *Unit* menu and then compare the Evap LWT value with that detected by the sample sensor
- If the temperature value measured by the unit sensor is different from the sample one, set the difference in the *Offset* parameter.

***Make sure to have a good water/ice mix and wait for the water/ice system temperature to stabilize before to proceed with the calibration.
Place both sensors (sample and unit) in the middle of the container in order to not affect the readings.***

7.8.1.2 Evaporator Entering Water Temperature

- Place the sample and Evap EWT sensors in a container with ice
- Enter in *Commission Unit* → *Calibrate Sensors* → *Unit* menu and then compare the Evap EWT value with that detected by the sample sensor
- If the temperature value measured by the unit sensor is different from the sample one, set the difference in the *Offset* parameter.

***Make sure to have a good water/ice mix and wait for the water/ice system temperature to stabilize before to proceed with the calibration.
Place both sensors (sample and unit) in the middle of the container in order to not affect the readings.***

7.8.1.3 Outside Air Temperature

- Place the sample and suction temperature sensors in ambient temperature
- Enter in *Commission Unit* → *Sensors Calibration* → *Unit* menu and then compare the OAT value with that detected by the sample sensor
- If the temperature value measured by the unit sensor is different from the sample one, set the difference in the *Offset* parameter.

Make sure to have a stable air condition and wait until read unit and sample temperatures are stabilized respect to air ambient temperature before to proceed with the calibration.

7.8.2 Check and calibration of circuit temperature sensors

Calibration of circuit temperature sensors is a fundamental step for the correct operation of the unit. There are two temperature sensors to be calibrated (for each circuit):

- The Suction temperature sensor (ST-1 & ST-2)
- The Discharge temperature sensor (DT-1 & DT-2)

7.8.2.1 Suction Temperature sensor

- Place the sample and suction temperature sensors in a container with ice
- Enter in *Commission Unit* → *Sensors Calibration* → *Circuit #1/2* menu and then compare the *Suction Tmp* value with that detected by the sample sensor
- If the temperature value measured by the unit sensor is different from the sample one, set the difference in the *Suction Offset* parameter.

***Make sure to have a good water/ice mix and wait for the water/ice system temperature to stabilize before to proceed with the calibration.
Place both sensors (sample and unit) in the middle of the container in order to not affect the readings.***

Suction temperature sensor is the most crucial of chiller's sensors as will guarantee the correct working of the EXV and consequent safe compressor running

7.8.2.2 Discharge temperature sensor

- Place the sample and discharge temperature sensors in ambient temperature.
- Enter in *Commission Unit* → *Sensors Calibration* → *Circuit #1/2* menu and then compare the *Discharge Tmp* value with that detected by the sample sensor.
- If the temperature value measured by the unit sensor is different from the sample one, set the difference in the *Disch Offset* parameter.

Make sure to have a stable air condition and wait until read unit and sample temperatures are stabilized respect to air ambient temperature before to proceed with the calibration.

7.8.2.3 Economizer temperature

- Place the sample and Economizer temperature sensors in ambient temperature.
- Enter in *Commission Unit* → *Calibrate Sensors* → *Circuit #1/2* menu and then compare the *Econ Temp* value with that detected by the sample sensor.
- If the temperature value measured by the unit sensor is different from the sample one, set the difference in the *Eco Tmp Offset* parameter.

Make sure to have a stable air condition and wait until read unit and sample temperatures are stabilized respect to air ambient temperature before to proceed with the calibration.

7.8.2.4 Liquid temperature

- Place the sample and Subcooling temperature sensors in ambient temperature.
- Enter in *Commission Unit* → *Calibrate Sensors* → *Circuit #1/2* menu and then compare the *Liquid Temp* value with that detected by the sample sensor.
- If the temperature value measured by the unit sensor is different from the sample one, set the difference in the *Liquid Tmp Offset* parameter.

Refer to Table A for the complete overview of the components positioning.

7.9 Dry Tests

Perform the Dry Tests by setting the unit in “test mode”:

1. Enter the “Technician Password” on the controller
2. Go in *Main Menu* → *Unit Mode* → *Mode*
3. Set *Test*

All the dry tests are performable through the following menu:

Main Menu → *Commission Unit* → *Manual Control*

7.9.1 Unit Alarm

Check the correct activation of the software general alarm:

Main Menu → *Commission Unit* → *Manual Control* → *Unit* → *Unit Alarm*

7.9.2 Pump #1/#2

Check the correct activation of the water pump (if it is controlled by the unit):

Main Menu → *Commission Unit* → *Manual Control* → *Unit* → *Pump #1/#2*

7.9.3 Circuit Alarm

Check the correct activation of the software general alarm:

Main Menu → *Commission Unit* → *Manual Control* → *Circuit #1/2* → *Circuit Alarm*

7.9.4 Fan

Check the correct functionality of the fans:

7.9.4.1 ON-OFF Fans

Main Menu → Commission Unit → Manual Control → Circuit # → Fan [number]

In this menu is possible to set ON or OFF the fan. Moreover, during this phase check the rotation sense of the fans, if it is right the force of the air must be from the floor to the top.

7.9.4.2 Brushless EC Fans

Main Menu → Commission Unit → Manual Control → Circuit # → Fan speed

In this menu is possible choose the capacity of the fan. Moreover, during this phase check the rotation sense of the fans, if it is right the force of the air must be from the floor to the top.

7.9.5 Oil/VFD Heaters

Check the correct activation of compressor oil and VFD resistances:

Main Menu → Commission Unit → Manual Control → Circuit #1/2 → Crankcase Heater

Main Menu → Commission Unit → Manual Control → Circuit #1/2 → VFD Heater

7.9.6 VR Slides

Check the correct activation of the compressor VR slides:

Main Menu → Commission Unit → Manual Control → Circuit #1/2 → VR#

By setting to On, the solenoid valve will be energized and its coil will generate a magnetic field.

Figure 1 Magnetic field check

7.9.7 Expansion Valve

Verify the correct operation of the EXV valves:

Main Menu → Commission Unit → Manual Control → Circuit #1/2 → EXV Position

And set the opening percentage, it is possible verify the movement of the piston inside the expansion valve through the glass post on it.

7.9.8 Eco Expansion Valve

Verify the correct operation of the Eco EXV valves:

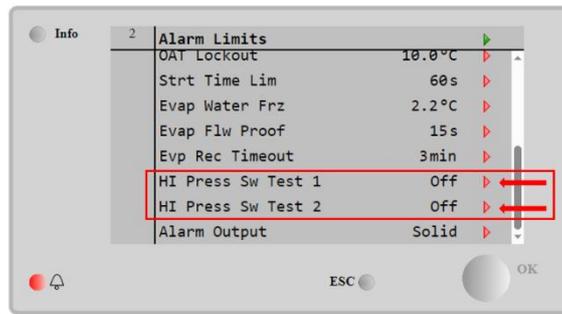

Main Menu → Commission Unit → Manual Control → Circuit #1/2 → EXV Position

And set the opening percentage, it is possible verify the movement of the piston inside the expansion valve through the glass post on it.

7.9.9 High Pressure Switches Test

To test the High-Pressure Switches:

Main Menu → Commission Unit → "Alarm Limits → HI Press Sw Test "#"

During this procedure high pressure relief valves may open. Before the test, verify that the relief valves are correctly calibrated. Keep a safe distance from the valves and verify, before the test procedure, that nobody is near the unit.

To perform the test, in the “Alarm limits” menu, set the HI Press Sw Test # to “On”, and then set Circuit 2. This setting ignores both the High pressure partialization and the High-pressure alarm referred to the High-pressure transducer readings.

During this procedure the circuit fans are switched OFF, allowing the high-pressure switch to open the circuit. The parameter will automatically be restored to OFF after the test.

During this procedure constantly check the high-pressure value.

- 1) Start the test on Circuit 1, constantly check the rising of the condensation pressure. Switch off the Unit if the pressure reaches the High-pressure switch set value (22.2 bar).
- 2) Wait until the intervention of the High-pressure switches. It should switch off the compressor at 22.2 bar (tolerance: +0 bar -1.8 bar)
- 3) Repeat the procedure for Circuit 2 accordingly.

This operation must be performed with accuracy. Use the Emergency button if necessary. If the test fails (the pressure rises a value over the High-pressure switch limit), there is an additional control which turns the unit off, when the pressure transducer reads 22.2 bar. Verify the root cause of the test failure before repeating the test. After the test is completed, manually reset the high-pressure switches by pushing the blue button on top of it and reset the alarm via the POL688 HMI. Turn on the compressors to continue the test.

7.9.10 Compressor addressing

Electrically disconnect the pressure transducer on the compressor (high or low) and check the activation of the related alarm on the correct circuit.

7.9.11 Anti-chattering kit

Check the correct activation of the compressor solenoid valves:

Main Menu → Commission Unit → Manual Control → Circuit #1/2 → Suct Sol Valve

Main Menu → Commission Unit → Manual Control → Circuit #1/2 → Disch Sol Valve

By setting to On, the solenoid valve will be energized and its coil will generate a magnetic field.

Figure 2 Magnetic field check

7.9.12 FC Water valve (Only EWFD and EWFS units)

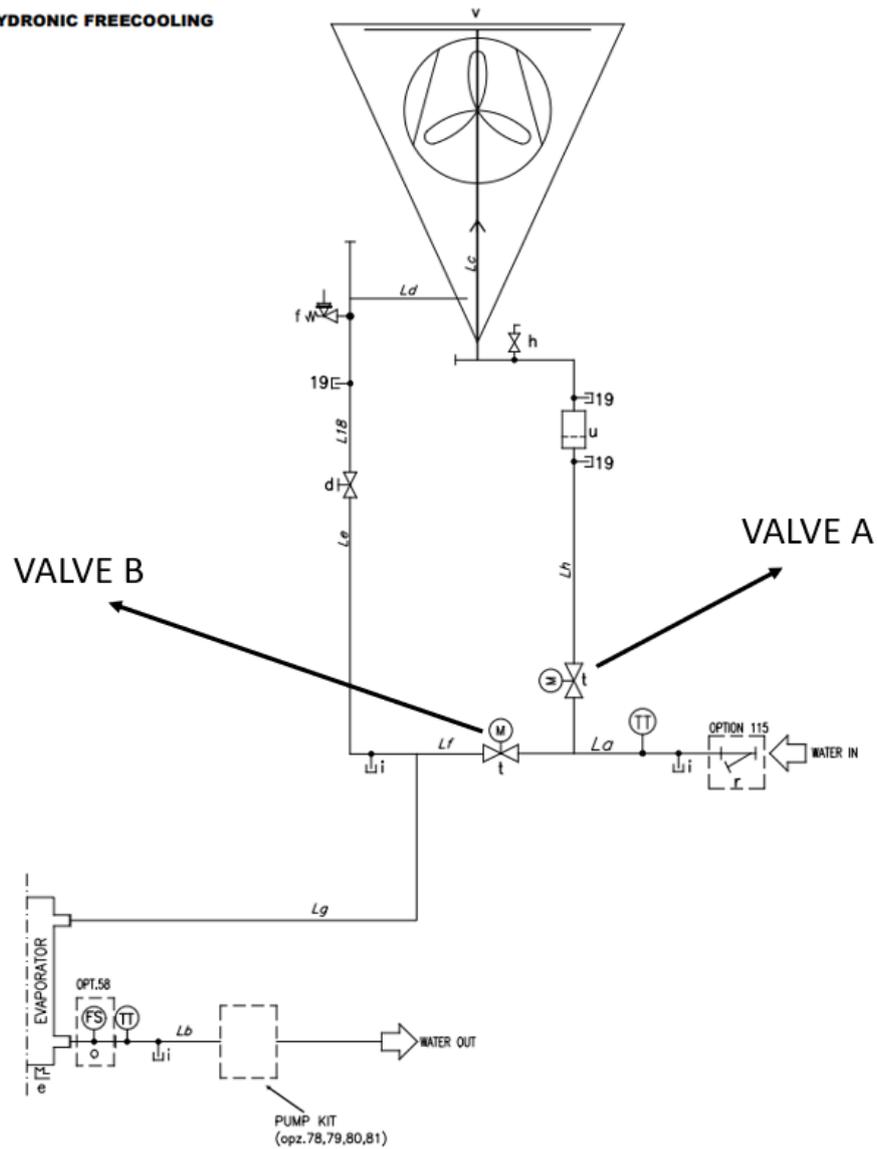

Before following the procedure described on below, be sure that the specific procedures described in the D-EIMAC01802-23_01EN (Paragraphs 4.8.3 and 4.8.4) has been carried out. The unit is shipped with the valve “d” closed and pressurized with nitrogen (up to 1-2 bar), therefore the freecooling coil must be correctly filled.

In hydronic freecooling unit there are two valves working in alternative way: when one is open, the other must be closed or viceversa.

Commission Unit → Manual control → Unit → Hydr FC Valve

Enabling the function, it must occur that valve A is open and valve B is closed. By disabling it, however, the exact opposite must occur. Check that the valves open and close completely and in the correct way of operation.

HYDRONIC FREECOOLING

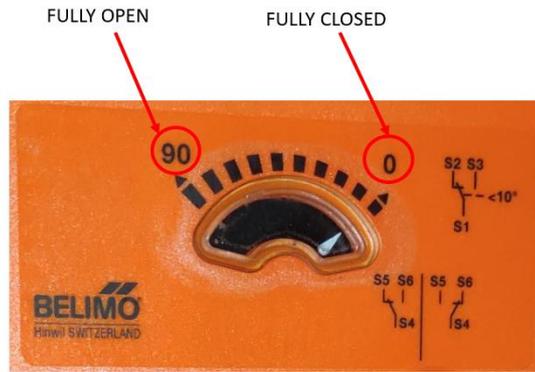

7.9.12.1 Visual inspection

It is strictly required that the valve and the actuator position are aligned, to guarantee the correct operation of the valve during the opening and closing transition.

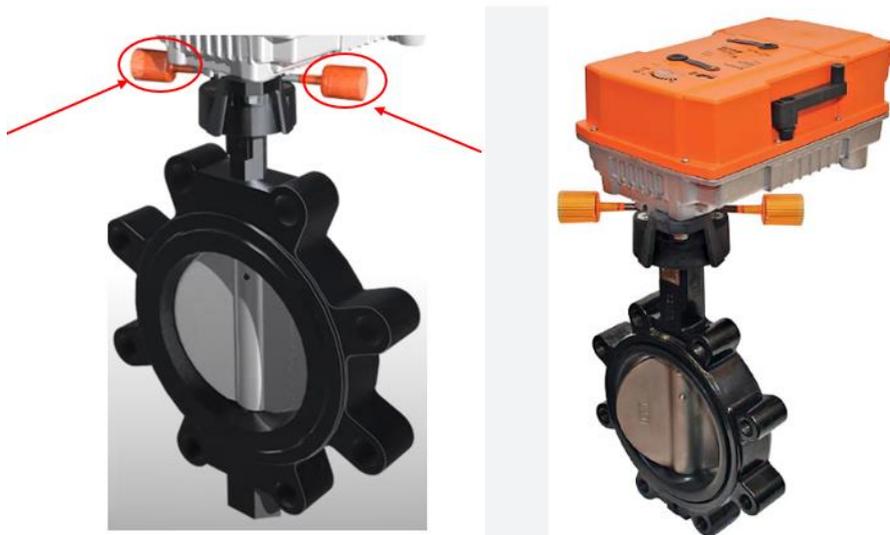

Belimo PRC2A model

To ensure the correct alignment of actuator and valve, it is necessary to check that when the actuator is in the 0° position, the valve is fully closed, and when it is at 90°, the valve is fully open.

Refer to the orange indicators located on the valve and the actuator indicator.

Belimo Actuator indicator

Belimo Valve indicator spring

Belimo PRC2A actuator model		
FC Mode	Valve A	Valve B
Disable	Valve position indication 	
	Actuator position indicator 	
Enable	Valve position indication 	
	Actuator position indicator 	

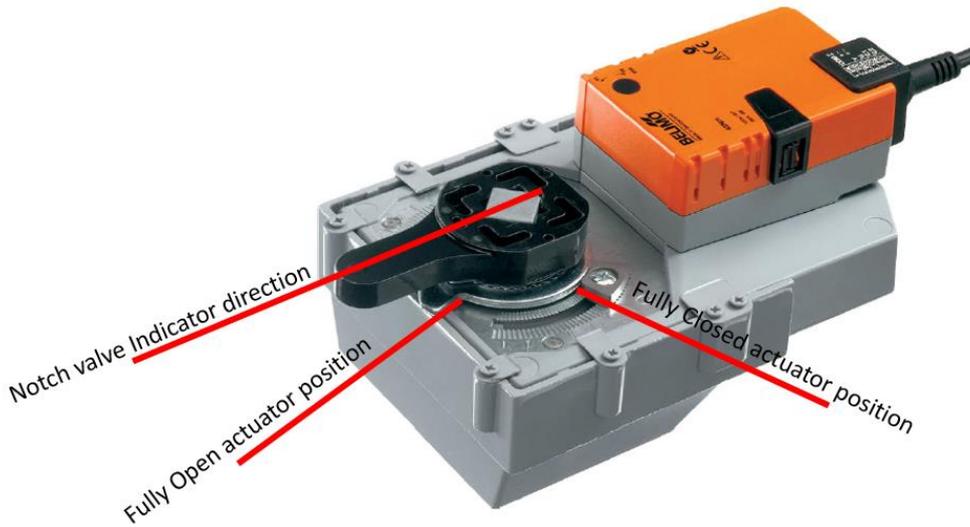

- If the orange indicators follow the flow direction, then the valve is open.
- If the orange indicators are perpendicular to the flow, then the valve is closed.

Check if the orange indicators springs are in the appropriate location.

Belimo GR230A model:

To ensure the correct alignment of actuator and valve, it is necessary to check that when the actuator is in the 0 position, the valve is fully closed.

1. Check that the notch valve indicator direction is aligned with the fully Open/Closed actuator position

Belimo GR230A actuator model		Valve A	Valve B
FC Mode			
Disable	Valve position indicator		
	Actuator position indicator		
Enable	Valve position indicator		
	Actuator position indicator		

- If the Notch valve indicator direction follows the flow direction, then the valve is open.
- If the Notch valve indicator direction is perpendicular to the flow, then the valve is closed.

Check if the orange indicators springs are in the appropriate location.

If the motor position does not match the valve opening position, it is possible to manually adjust the motor position. For the procedure, please contact the servicesupport@daikinapplied.eu.

8 Start-Up

The first data acquisition for each circuit must be performed in “Cooling mode”, in order to also check the correctness of the refrigerant charge by measuring the subcooling at the filter dryer (refer to E2.10 item of the *Commissioning Sheet*).

Make sure to open all the service valves before to perform the first unit Start-Up:

- **Liquid line**
- **Discharge line (if present)**
- **Suction line (if present)**
- **Turn on the water pump**

To do that, follow these steps, referring to the “Circuit #X”:

1. Enter the “Technician Password” on the controller
2. Go in Main Menu → Unit Mode → Mode and set Cool
3. Go in *Main Menu* → *Unit Enable*
4. Set *Circuit #1* → *Enable*, *Circuit #2* → *Disable*
5. Set *Unit* → *Enable*
6. Set on Local the switch Q0

The circuit is now ready for the Running Adjustment (*paragraph 8.1*)

8.1 Running Adjustments

Running Adjustments must be separately performed for each circuit while it is running near the rating conditions.

Make sure that the circuit is working in cooling mode in stable conditions in order to don't affect the following operations result

Make sure that the circuit status is “Run: Normal” before to proceed with the Running Adjustments

8.1.1 Check and calibration of pressure transducers

Calibration of pressure transducers is a fundamental step for the correct operation of the unit. There are two pressure sensors to be calibrated (for each circuit):

- The suction pressure transducers
- The discharge pressure transducers
- The oil pressure transducer

8.1.1.1 Evaporator Pressure

- Connect the sample transducer to the “T shape” pressure port on which the suction pressure transducer is installed.
- With the unit on, with the *Suction Temperature* of $7^{\circ}\text{C} \pm 1^{\circ}\text{C}$ and before making gas charge adjustments, enter the *Commission Unit* → *Calibrate Sensors* → *Circuit #1/2* menu and then compare the *Evap Pressure* value with that detected by sample transducer.
- If the pressure value measured by the unit transducer is different from the sample one, set the difference in the *Evp Pr Offset* parameter.

Sample transducer is the measuring device has been calibrated and it must be very accurate.

If this difference is greater than ± 100 kPa replace the transducer and repeat the operation.

Evaporator pressure transducer is the most crucial of chiller's transducer as will guarantee the correct working of the EXV with consequent safe compressor running and since all low-pressure safeties are based on its readings.

8.1.1.2 Condenser Pressure

- Connect the transducer to the "T shape" pressure port on which the discharge pressure transducer is installed.
 - With the unit on, enter in *Commission Unit* → *Calibrate Sensors* → *Circuit #1/2* menu and then compare the *Cond Pressure* value with the one detected by the sample transducer.
 - If the value of the pressure measured by the unit transducer is different from the sample one, set the difference in the *Cond Pr Offset* parameter.
-

If this difference is greater than ± 100 kPa replace the transducer and repeat the operation.

8.1.1.3 Oil Pressure

- Connect the sample transducer to the "T shape" pressure port on which the oil pressure transducer is installed.
 - With the unit on, enter in *Commission Unit* → *Calibrate Sensors* → *Circuit #1/2* menu and then compare *Oil Pressure* value with *Condenser Pressure*.
 - If the value of the pressure measured by the *Oil Pressure* transducer is different from the *Condenser Pressure*, set the difference in the *Oil PR Offset* parameter.
-

If this difference is greater than ± 100 kPa replace the transducer and repeat the operation.

8.1.1.4 Economizer pressure

- Connect the sample transducer to the "T shape" pressure port on which the economizer pressure transducer is installed.
 - With the unit on, enter in *Commission Unit* → *Calibrate Sensors* → *Circuit #1/2* menu and then compare the *Econ Prs* value with the one detected by the sample transducer.
 - If the value of the pressure measured by the unit transducer is different from the sample one, set the difference in the *Econ Prs Offset* parameter.
-

If this difference is greater than ± 100 kPa replace the transducer and repeat the operation.

8.1.2 Subcooling measurement point

The calculation of the subcooling at the filter dryer (in addition to the visual inspection of any flash gas on the liquid sight glass) is the main parameter by which the need for a charge adjustment is established. This quantity must be quantified with the least possible margin of error.

What's needed:

- Additional pressure transducer
- Additional temperature sensor

Proceed to the installation as follows:

- The pressure sensor must be installed on one of the two pressure points on the corner tap, close to the dryer filter.
- The temperature sensor must be installed on a smooth pipe section (not on a weld, for example), as close as possible to the pressure sensor mentioned above.

Temperature measurements are among the most difficult to perform. Install the temperature probes with a correct quantity of thermal paste, tighten the probes firmly to the pipe and abundantly insulate the probes so that external agents cannot affect the measurement.

The optional refrigerant charge depends by the unit configuration. Is possible identify the right refrigerant charge while the unit is working through the following conditions:

- For Standard units, heat reclaim units and Hydronic Freecooling units (operating in Mechanical cooling or Mixed freecooling)
 - Subcooling (at the dryer filter) = 7 ± 4 °C
 - Suction Super Heat = 5 ± 1 °C

The charge adjustment has to be performed step-by-step, adding or removing refrigerant per time according to the table below:

Circuit Refrigerant Charge	Refrigerant Charge step adjustment
1 ÷ 10 kg	100 g
10,1 ÷ 50 kg	500 g
50,5 ÷ 100 kg	1 kg
101 ÷ 500 kg	2 kg
>500 kg	10 kg

After every charge step, wait 5 minutes after the liquid temperature stabilizing before to proceed with the next eventual adjustment step.

8.2 Running Safeties Test

8.2.1 Flow Switches

With the running unit, disable the water pumps and check if “Water Flow Loss” alarm appears after 30sec. If not, check proceed with the check of correct flow switch installation and calibration.

8.3 Data acquisition

Make sure that the circuit is working in stable conditions to don't affect the Data Acquisition

- Data acquisition has to be performed according to the **Data Acquisition** section of the Commissioning Sheet.
- Data acquisition has to be separately performed for each circuit in Chiller and Free Cooling mode. To select the circuit working mode refer to the following setting:

Main Menu → View/Set Unit → Hydronic FreeCooling

Disable this setpoint for testing the unit in Mechanical mode and through the keypad choose the circuit to put in operation.

- It is recommended to let the circuit reach the 100% of capacity before to proceed with the data acquisition (according to the plant load conditions).
- It is recommended to let the circuit reach stable operating conditions before to proceed with the data acquisition.

To evaluate the stable operation of the unit check, following conditions must be satisfied:

- Circuit Status equal to “Run=Normal”
- ELWT and/or CLWT is as near as possible to the relative setpoint.
- EXV is working in Superheat-Pressure mode:
 - Main Menu → View/Set Circuit → Circuit# → EXV → State = Pressure
- Evaporator Pressure is equal to the Pressure target for 5 minutes continuously:
 - Main Menu → View/Set Circuit → Circuit# → EXV → Evap Target

CLIMATIX Scope Light data recording during commissioning is strongly suggested.
For all material required for the recording get in contact with servicesupport@daikinapplied.eu

8.3.1 Only for EWFD and EWFS units

This particular test can be performed only if the freecooling activation conditions are reached in the installation site.

After the test in Mechanical mode, if some load on the plant side is still present, is possible test the unit in Free Cooling mode. To select the Free Cooling mode, refer to the following setting:

Main Menu → View/Set Unit → Hydronic Free Cooling

Enable this setpoint and record the data during the freecooling working operations.
To perform this test, be sure to disable both circuit in the unit enable menu:

Main Menu → Unit Enable → Circuit 1 → Disable

Main Menu → Unit Enable → Circuit 2 → Disable

CLIMATIX Scope Light data recording during commissioning is strongly suggested.
For all material required for the recording get in contact with servicesupport@daikinapplied.eu

9.3 Pump VFD Settings

9.3.1 Table AC - Pump Inverter Settings

DESCRIPTION	PARAMETER	SETTING	DEFAULT	Notes
Regional Settings	0-03	Default	[0] International	
Grid Type	0-06	[12] 380-440V/50Hz	[12] 380-440V/50Hz	Verify Input Voltage (V) and frequency (Hz) on R.M.
Motor Construction	1-10	Default	[0] Asynchron	
Motor Power	1-20	Default	Size Related	Verify Motor Nameplate Data
Motor Voltage	1-22	[400 V]	Size Related	Verify Motor Nameplate Data
Motor Frequency	1-23	[50 Hz]	Size Related	Verify Motor Nameplate Data
Motor Current	1-24	Default	Size Related	Verify Motor Nameplate Data
Motor Nominal Speed	1-25	See Motor Nameplate Data	Size Related	Verify Motor Nameplate Data
Flying Start	1-73	Default	[0] Disabled	
Minimum Reference	3-02	See Notes	[0]	Set 50 (Hz) to test the unit - With external reference speed (terminal 53 - 0-10V), it is factory set to 40 Hz
Maximum Reference	3-03	[50]	[50]	Set as 1-23 unless a different custom speed is required
Ramp 1 Ramp up Time	3-41	[10 s]	Size Related	time to reach 1-23 frequency
Ramp 1 Ramp Down Time	3-42	[10 s]	Size Related	time to stop from 1-23 frequency
Motor Speed Low Limit [Hz]	4-12	Default	[0 Hz]	
Motor Speed High Limit [Hz]	4-14	Default	[65 Hz]	
Max Output Frequency	4-19	Default	Size Related	
Function Relay 1	5-40	[9] Alarm	[0] No operation	
Function Relay 2	5-40	[6] Running / no warning	[1] Control ready	
Terminal 53 Low Voltage	6-10	Default	[0,07 V]	Set by Control Board 1 T8-X2 (Pump VFD Speed)wire 762
Terminal 53 High Voltage	6-11	Default	[10 V]	Set by Control Board 1 T8-X2 (Pump VFD Speed)wire 762
Terminal 53 Low Current	6-12	Default	[4 mA]	
Terminal 53 High Current	6-13	Default	[20 mA]	
Terminal 53 mode	6-19	Default	[1] Voltage mode	Current or voltage input mode [0] Current mode ; [1] Voltage mode

9.4 Pre-Commissioning Sheet

Table AD - Pre-Commissioning Sheet

Job Name _____

Unit Model No.(s) _____

Daikin Serial Unit No _____

General	Yes	No	N/A
Check for external damage	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Open all isolation and / or shut-off valves	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Verify that the unit is pressurized with refrigerant in all of its parts before making the connection to the hydraulic circuit.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Check the oil level in the compressors	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Control wells, thermometers, manometers, controls, etc. installed	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Availability of at least 25% of the machine load for testing and control settings	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Refrigerated water	Yes	No	N/A
Piping completion	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Install the water filter (even when not supplied) at the inlet of the exchangers.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Install a flow switch, calibrate and test (off-on-off switching according to the water flow) the flow	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Water circuit filling, air bleeding	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Pump installation, (rotation check), filter cleaning	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Operation of the controls (three-way valve, bypass valve, damper, etc.)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Water circuit operation and flow balance	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Check that all water sensors are correctly fixed in the heat exchange	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Electrical circuit	Yes	No	N/A
Power cables connected to the electrical panel	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Starter and wired interlocking of the pump	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Electrical connection in compliance with local electrical regulations	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Install a main switch upstream of the unit, the main fuses and, where required by the national laws of the country of installation, a ground fault detector.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Connect the pump contact(s) in series with the contact of the flow switch(es), so that the unit can operate only when the water pumps are running, and the water flow is sufficient.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Provide the main voltage and check that it is within $\pm 10\%$ of the classification given on the nameplate.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Under no condition should these units be started prior to the authorized start-up by Daikin Applied. Failure to follow this warning may result in serious equipment damage and will negate the warranty. All installation work has been completed as checked above; the system has been inspected and the unit is ready for start-up

<p>As Commissioning is a technical process performed - before the Chiller is put into definitive operation - by an "Authorised Engineer". As Commissioning is done and is intended to achieve the following specific limited objectives: - verify and document (via checklist) that the Chiller is installed according to the manufacturers installation manual and operation manual. - configure the Chiller to a set of manufacturers defined parameters in order to secure the correct performance of the Chiller in the specific site related operating conditions. Therefore the Commissioning process does not take away from or reduce the responsibility of the System Designers and/or Installers to provide a finished and fully functioning system.</p>			

10 APPENDIX

10.1 VFD Addressing procedure by controller

INFORMATION

This procedure should not be carried out during the commissioning.
Must only be carried out when replacing inverters.

10.1.1 Circuit 2 compressor inverter address configuration

CAUTION

In phase of commissioning this setting is not to be carried out.
The inverter address configuration is necessary only after a replacement of the inverter P.C.B. on Circuit 2.

1. Power the circuit 2 compressor inverter
2. Remove power from the circuit 1 compressor inverter
3. Wait 5 minutes
4. Enter technician password
5. Open the menu: View / Set Unit -> Compressor VFD Settings -> Comp VFD Address
6. Execute the writing command by setting Set Inv2 Addr = Execute and wait for it to automatically return to Set Inv2 Addr = Hold. During the execution of the write command, "Writing" will appear on the display. At the end of the command, the words "Failed" or "Pass" will be displayed depending on the outcome of the command. "Failed" identifies that the address has not been written, while the completely correct command is identified with the word "Pass".
7. Remove power from the circuit 2 compressor inverter
8. Wait 5 minutes
9. Power up both inverters and check that the addresses on the two compressors are correct. For verification, simply remove the suction pressure transducer and check that the alarm is associated with the corresponding circuit.

10.1.2 Reset compressor inverter address circuit 1

CAUTION

Warning! The following procedure should only be carried out if, by mistake, the circuit 1 compressor inverter has address 2.

1. Power the circuit 1 compressor inverter
2. Remove power from the circuit 2 compressor inverter
3. Wait 5 minutes
4. Enter Technician password
5. Open the menu: View / Set Unit -> Compressor VFD Setup -> Comp VFD Address
6. Execute the write command by setting Reset Default = Execute and wait for automatically go back to Reset Default = Hold. During the execution of the writing, "Writing" will appear on the display. At the end of the command, the words "Failed" or "Pass" will be displayed depending on the outcome of the command. "Failed" identifies that the address has not been written, while the completely correct of the command comes identified with the word "Pass".
7. Remove power from the circuit 1 compressor inverter
8. Wait 5 minutes
9. Power up both inverters and check that the addresses on the two compressors are

correct. For verification, simply remove the suction pressure transducer and check that the alarm is associated with the corresponding circuit.

10.1.3 Filter setting on the pressure transducer reading

In case of dual machine, this procedure can be carried out only after performing the configuration of the circuit 2 compressor address.

1. Power up both compressors
2. Enter Technician password in the controller
3. Open the menu: View / Set Unit -> Compressor VFD Setup -> Filter
4. Execute the writing command by setting Set Inv1 Fltr = Execute and wait for it to automatically return to Set Inv1 Fltr = Hold.
 1. As for writing the address, the word "Writing" will appear during the execution of the command and at the end the word "Failed" or "Pass" will appear to identify the outcome of the writing.
5. Execute the writing command by setting Set Inv2 Fltr = Execute and wait for it to automatically return to Set Inv2 Fltr = Hold.
 2. As for writing the address, the word "Writing" will appear during the execution of the command and at the end the word "Failed" or "Pass" will appear to identify the outcome of the writing.
